SHAPE 2010
CHILD SURVEY
Survey of the Health of All the Population and Environment

Hennepin County - HSPHD Assessment Unit /SHAPE Team
SHAPE 2010 is a project of the Hennepin County Human Services and Public Health Department.

SHAPE 2010 was funded in part by a grant from the Minnesota Statewide Health Improvement Program.

Overview of the SHAPE Survey
What is SHAPE?
Survey of the Health of All the Population and Environment

Public health surveillance effort used to collect local data on health status and factors that affect residents' health and well-being.

Used for public health policy planning and community assessment.

The SHAPE surveys have been conducted every four years in Hennepin County:

- SHAPE 1998 – Adult Survey
- SHAPE 2002 – Adult Survey
- SHAPE 2006 – Adult Survey & Child Survey
- SHAPE 2010 – Adult Survey & Child Survey
The **SHAPE 2006 – Child Survey** collected information using a **phone survey** of 4,038 Hennepin County households.

The **SHAPE 2010 – Child Survey** collected information using a **mail survey** of 2,197 Hennepin County households.

In both years the surveys were approximately 30 minutes in length, and involved about 100 questions.

*The numbers in this table are not weighted; they are based on the survey responses only and should not be interpreted as estimates based on the population.*
One child (the child with the next birthday) was selected from the randomly sampled households.

The surveys were completed by the adult most knowledgeable about the selected child’s health.

Survey responses are weighted to reflect the known population characteristics.
The surveys included questions on a broad range of health and well-being topics.

Survey items were age-specific; they were selected to represent relevant developmental stages of childhood and adolescence.

Roughly half of the households provided survey responses from both an adult and a child; the other half were “child survey only” households.
SHAPE 2010– Child Survey: Topics

All children aged 0 to 17

- Overall health and chronic conditions
- Health insurance coverage and access to care
- Environment and use of community amenities

Age-based subgroups

- Weight, nutrition and physical activity
- Family connectedness and communication
- Early childhood and pre-school readiness
- School-aged children’s activities

Key findings from the SHAPE 2010 - Child Survey
SHAPE 2010 – Child Survey: Key findings

□ Overall, Hennepin County children are in good health

Most are on the right path to establishing habits and patterns that promote healthy growth and development, as well as establishing a strong foundation for life-long health and well-being.
Most children are off to a strong start, but key health indicators show declines in teen years

Most Hennepin County infants, toddlers and children up to age 9 are doing very well.

However, many of the key health indicators begin to “flatten out” or decline for youth aged 14 to 17.
Economic well-being is necessary for good health

Children from low income families were significantly lower on many important measures of health and well-being than their peers.
Low Income Households

Income level comparison groups were constructed using three criteria, any one of which would indicate a low income household:

- Child currently receives free or reduced price meals at school
- Child is covered by an income-based public health insurance program
- Household income and size indicate that the household is at or below 200 percent of the Federal Poverty Level (FPL)

Overall Health and Chronic Conditions
SHAPE 2006 & 2010: Key findings

- **Overall Health**

  In both 2006 and 2010, most parents reported that their child was in *excellent* or *very good* overall health.

  Very few parents in either year reported that the child’s health was *fair* or *poor*. 
Overall Health

How would you describe your child’s health … ?

Hennepin County 2006
Aged 0 to 17 years

- Excellent: 58.7%
- Very Good: 27.1%
- Good: 11.5%
- Fair: 2.4%
- Poor: 0.4%

Hennepin County 2010
Aged 0 to 17 years

- Excellent: 62.1%
- Very Good: 26.4%
- Good: 9.9%
- Fair: 1.3%
- Poor: 0.3%
Overall Health

Children from low income households were less likely to enjoy excellent overall health as compared to their peers.

The differences between income level groups were statistically significant in both 2006 and 2010.
Percent reported to be in excellent health by household income level

SHAPE 2010 – Child Survey: Key findings

- Serious health conditions affect about one in ten children in Hennepin County

  10.6% currently have a serious physical, behavioral or developmental condition.

  8.4% have a serious condition expected to last for 12 months or longer.
Percent who currently have a serious health condition by age and household income

Hennepin County Children 2010

*Statistically significant differences were noted among age groups and between income based groups.*
Asthma rates in 2010 were nearly identical to 2006

In 2010, 13.2% of Hennepin County children had ever been diagnosed with asthma (compared to 13.1% in 2006).

In 2010, 9.2% of Hennepin County children were currently reported to have asthma (compared to 9.3% in 2006).
Asthma impacts were notable for low income children

In 2010, low income children were more likely to be diagnosed with asthma, and to currently have asthma, than their peers.

This difference was not found in the 2006 results for asthma.
Percent who were ever told by a doctor or other health professional that they have asthma by household income level

*Statistically significant differences were noted between income level groups in 2010.
Percent who currently have asthma by household income level

SHAPE 2006 – Child Survey
Age 0 to 17

SHAPE 2010 – Child Survey
Age 0 to 17

*Statistically significant differences were noted between income level groups in 2010.
Rates for having asthma attacks are similar regardless of income level

Children with asthma, regardless of household income level, reported having asthma attacks in the past 12 months at nearly the same rates.

Although they appear to be higher, there were no statistically significant differences in the rates over time.
Percent who have had an asthma attack within the past 12 months by household income level

SHAPE 2006 – Child Survey
Age 0 to 17

SHAPE 2010 – Child Survey
Age 0 to 17

*No statistically significant differences were noted between income level groups or over time.
Asthma impacts are notable for low income children

In 2010, low income children were three times more likely to require visits to the emergency room or urgent care center for treatment as the result of an asthma attack. The rate ratio for emergency care for asthma attacks is 24.9 to 8.2, or approximately 3 to 1.
Percent who went to ER or Urgent Care during past 12 months due to asthma attack by household income level

*Statistically significant differences were noted over time for both income groups; the rate ratio difference for 2010 was greater than 3 to 1.
Mental Health and Behavioral Conditions
Mental health concerns were reported for one out of seven adolescents in Hennepin County.

8.7% of all children aged 4 to 17 have ever been diagnosed with depression or anxiety (compared to 6.2% in SHAPE 2006).

14.7% of adolescents aged 14 to 17 have ever been diagnosed with depression or anxiety by a doctor or other professional.
Percent who were ever told by a doctor or other health professional that they have depression or anxiety by age and household income level

Hennepin County Children 2010 – Age 4 to 17

*Statistically significant differences were noted among age groups, but not between income based groups.*
Percent who were told by a doctor or other health professional that they have depression or anxiety by grade level and gender

Hennepin County Children 2010

*Gender data represent children aged 4 to 17. Statistically significant differences were noted among grade level groups, but not gender.
The diagnosis rate for depression or anxiety is one of the rare exceptions where low income children appear to be on par with their peers.

No statistically significant differences between income level groups were found for either the SHAPE 2006 or the SHAPE 2010 results.
Percent who were ever told by a doctor or other health professional that they have depression or anxiety by household income level

SHAPE 2006 – Child Survey
Age 4 to 17

SHAPE 2010 – Child Survey
Age 4 to 17

*No statistically significant differences were noted between income level groups.
SHAPE 2006 & 2010:
Key findings on Income Level Differences

Children’s Mental Health

In both 2006 and 2010, low income parents were significantly more likely to be told by a teacher, school counselor or health professional that their child needed professional help for a behavioral or emotional problem than those who were not from low income households.
Percent who were ever told by a doctor, or school professional that the child needed help for an emotional/behavioral issue by household income

SHAPE 2006 – Child Survey Age 0 to 17

SHAPE 2010 – Child Survey Age 0 to 17

*Statistically significant differences were noted between income groups in both 2006 and 2010.
Percent who received needed mental health care
Statewide and National Comparisons

Hennepin County Children, 2006 & 2010
US & Minnesota Children, 2007

- **Hennepin County Children, 2006 & 2010**
  - 2006: 79.7%
  - 2010: 77.9%

Behavioral Health Conditions
ADD/ADHD

In 2010, 10.0 percent of Hennepin County children aged 4 to 17 were reported to have ever been diagnosed with Attention Deficit Disorders (ADD or ADHD).

Although the rate reported for 2010 appears to be higher than 2006, the difference over time was not statistically significant.
Percent who were ever told by a doctor or other professional that they have ADD/ADHD

SHAPE 2006 – Child Survey
Age 4 to 17

SHAPE 2010 – Child Survey
Age 4 to 17

*No statistically significant differences were noted over time from 2006 to 2010.
The ADD/ADHD rate reported for low income children was statistically significantly higher over time from 2006 to 2010 (rising from 8.5% to 14.1%).

However, the differences between the two income level groups for ADD/ADHD were not statistically significant in either 2006 or 2010.
Percent who were ever told by a doctor or other health professional that they have ADD or ADHD by household income level

*Statistically significant differences were noted over time for children from low income households.
Neurological Conditions
Autism/ASD

In 2010, 2.5 percent of Hennepin County children aged 0 to 17 were reported to have been diagnosed with autism or ASD.

Although the results for 2010 appear to be somewhat higher, this rate was not statistically significantly greater than the diagnosis rate for autism or ASD that was found in 2006.
Percent who were ever told by a doctor or other health professional that they have autism or ASD, 2006 vs 2010

*No statistically significant differences were noted over time from 2006 to 2010.
Autism/ASD rates for income level groups

The *autism or ASD* rate reported for **non-low income** children was significantly higher over time from 2006 to 2010.

However, the differences between income level groups for *autism or ASD* were not statistically significant in either 2006 or 2010.
Percent who were ever told by a doctor or other health professional that they have autism or ASD by household income level

*Statistically significant differences were noted over time for children from non-low income households.

SHAPE 2010 - Child Survey: Comments from survey participants

- My child is late on his 3 year old checkup because we have no insurance and we can't afford to pay out of pocket. I feel like a horrible parent.

- We have a horrible $10,000 deductible insurance policy on our kids because we can't afford the family plan through my work. Luckily our kids are healthy.

- While we buy our own medical insurance, it is only major medical coverage. We are completely going into debt to even have this coverage - to cover the premiums and then the hundreds of dollars we pay each time a child gets sick.
I paid $258 for a sports physical for my 14 year old girl. I proposed that if my daughter could do more sit ups, push ups, jumping jacks and distance running than the doctor could, that he should waive the bill. He declined.

A child may have health insurance but it is very expensive to the family. Good survey questions may be: Are all people in your house health insured? Does the child take daily prescriptions? Has the child experienced a stressful life event in the past 12 months with an increased risk of mental health issues?

I need medical care for all my children in the home. Most of my children have not been seen doctor for preventative care for more than 5 years now.
Weight and Nutrition
SHAPE 2010 – Child Survey: Key findings

- [ ] Children’s healthy weight – room for improvement in parental awareness

Nearly one out of five Hennepin County parents “do not know” or “are not sure” how much their child currently weighs.

Parents from low income households were significantly less likely to know their child’s current weight.
Does the parent know the child’s current weight?

Hennepin County Children 2010

- Yes: 81.0%
- Not: 7.4%
- Not Sure: 11.6%
Percent of parents who reported that they know their child’s current weight by age and household income

Hennepin County Children 2010

*Statistically significant differences were noted for household income groups.
Clinical role in improving parental awareness

Even if the child was weighed by a doctor or health professional within the past year, nearly one out of six parents stated that the doctor or health professional “never said anything” about their child’s weight.

This result matches the findings from the SHAPE 2006 – Child Survey.
Has a doctor, nurse or other health professional recently told you that the child weighs too much, too little, or is at the right weight? 2006 vs 2010

Hennepin County 2006 Aged 0 to 17 years
- Weighs too much: 5.1%
- Weighs too little: 3.7%
- No one has said: 18.0%

SHAPE 2010 - Child Survey: Comments from survey participants

☐ There should be a widening of the food stamp qualifications. It is hard to provide fresh fruit and vegetables for my children and stay within my income!

☐ School lunches are horrible. Please focus your efforts in providing healthy, fresh food at school. It results in better learning and instills good eating habits in our kids. Currently we have to continuously educate our kids about why school lunches and fast food are unhealthy.

☐ We serve veggies everyday but our child may not eat them. Then on another day, he will eat twice as much as the day before.
Physical Activity and Screen Time
On a typical school day, how much time does the child spend being physically active or playing sports?

Hennepin County 2010
Aged 6 to 17 years

- Less than 1 hour: 51.9%
- 1 to 2 hours: 30.9%
- More than 2 hours: 13.6%
- No time: 3.6%

- **4 or more times**: 1.8%

*Statistically significant difference were noted by age group.*
SHAPE 2010 - Child Survey: Comments from survey participants

- We have four children whose ages range from 10 to 16. We would like very much for them to participate in organized sports, but we cannot afford to pay even the minimum fee required for participation.

- I think the lack of sports/playtime in school is sending the wrong message to kids today. Schools are saying it is not important enough to put it in the daily schedule. My daughter receives 15 minutes after lunch and only one hour per week of PE.

- Schools need more physical activity, not just teaching standardized tests.
School recess time is short, 20 minutes, and gym is offered twice a week for 40 minutes. Being active for 60 minutes is rare ...

We need more funding in Community centers for staff/personnel to facilitate healthy activities for our children that would stimulate their minds and promote physical fitness for both boys and girls. Please!!
On a typical school day, how much time does the child spend playing electronic games, watching TV or using computers for recreation?

Hennepin County 2010
Aged 6 to 17 years

Community Amenities
SHAPE 2010 – Child Survey: Key findings

- Use of common community amenities

Common community amenities include:

- Walking trails, bike paths or sidewalks
- Parks or playgrounds
- Library or bookmobile
- Beach, swimming pool or water park
- Community center, YMCA, Boys’ or Girls’ Clubs
- Skating rink, roller rink or skate board park
SHAPE 2010 – Child Survey: Key findings

- No significant urban vs suburban differences detected in use of common amenities

Four of six common community amenities were used monthly by most children across Hennepin County.

As would be expected, seasonal use of beaches and swimming pools was strong, and use of skating facilities was varied.
Percent using the community amenity at least once in past month by location of residence
Hennepin County Children 2010

*No statistically significant differences were noted between groups based on the location of residence (urban vs suburban).*
Percent using the community amenity at least once in past month by location of residence
Hennepin County Children 2010

*No statistically significant differences were noted between groups based on the location of residence (urban vs suburban).*
SHAPE 2010 – Child Survey: Key findings

- Regular use of community amenities differs by age and household income level

“Regular use” of an amenity was defined as **four or more times in the past month**.

For small children, “use” could include walking with them in a stroller, taking them for a bike ride, or bringing them to a playground, park, library, pool or community center.
Percent using walking trails, bike paths or sidewalks, four or more times in past month by age and household income

Hennepin County Children 2010

Hennepin County Children 2010

*Statistically significant differences were noted among age groups, but not for household income groups.
Family Connectedness and Communication
Family connectedness and health – mealtimes matter

Several recent studies have found important links between “family connectedness” and health outcomes for children including:

- the child is in “excellent” overall health
- the child is “happy” and has “positive self-worth”
- the child eats more nutritious foods daily
- significantly better results for children on asthma medications.
SHAPE 2010 – Child Survey: Key findings

- **Family mealtimes together**

  48.5% of Hennepin County children have at least one meal with their families on all 7 days per week.

  This is similar to results found in the SHAPE 2006 – Child Survey.
During the past week, on how many days did most or all of the family members who live in the household eat at least one meal together?

2006 vs 2010

Hennepin County 2006
Aged 0 to 17 years

- All 7 days: 47.5%
- 5 or 6 days: 20.1%

*Statistically significant differences were noted over time from 2006 to 2010.*
SHAPE 2010 – Child Survey: Key findings

- Child care arrangements

Overall, 45.4% of Hennepin County children aged 0 to 5 are currently receiving child care for at least 10 hours per week from someone other than their parents or other adult relatives.

Some statistically significant differences were noted in child care patterns based on household income level.
Percent receiving child care for 10 or more hours per week by age and household income

Hennepin County Children 2010

*Statistically significant differences were noted for income level groups, but not for age groups. This question was limited to children aged 0 to 5 years old.
Percent of parents who had to change work hours or quit a job due to problems with child care by age and household income

Hennepin County Children 2010

*Statistically significant differences were noted for income level groups, but not for age groups. This question was limited to children aged 0 to 5 years old.
SHAPE 2010 – Child Survey: Key findings

Pre-school activities

Parents of children aged 0 to 5 were asked about various activities that stimulate brain development and foster language/learning skills.

While nearly all parents reported that they engaged in most of these activities weekly, some significant differences were noted in terms of regularly engaging in these activities at least four or more times a week.
Percent who tell stories or read books with their child four or more times per week by age and household income

Hennepin County Children 2010

*Statistically significant differences were noted for income level groups, but not for age groups. This question was limited to children aged 0 to 5 years old.*
Percent who sing songs with their child four or more times per week by age and household income

Hennepin County Children 2010

*Statistically significant differences were noted for age groups, but not for income level groups. This question was limited to children aged 0 to 5 years old.
Percent who practice counting or play number games with their child four or more times per week by age and household income

Hennepin County Children 2010

*No statistically significant differences were noted for age groups or income level groups. This question was limited to children aged 0 to 5 years old.*
Percent who engage in physical activities with their child four or more times per week by age and household income

Hennepin County Children 2010

*No statistically significant differences were noted for age groups or income level groups. This question was limited to children aged 0 to 5 years old.*
SHAPE 2010 – Child Survey: Key findings

- Milestones for school readiness – some significant improvements noted from 2006 to 2010

Some important improvements over time have been noted in the pre-school readiness measures, including statistically significant increases in alphabet recognition and basic counting skills.

However, only four out of ten children aged 3 to 5 are currently able to count above 20.
Can the child recognize the letters of the alphabet? 2006 vs 2010

Hennepin County 2006  
Aged 0 to 5 years

- All of them: 40.5%
- Most: 27.3%
- Some: 28.1%
- None: 4.1%

Hennepin County 2010  
Aged 0 to 5 years

*No statistically significant differences were noted over time.*
Percent of children aged 3 to 5 who meet the basic milestones for pre-school readiness
2006 vs 2010
Hennepin County Children 2010

*Statistically significant differences were noted from 2006 to 2010 for recognizing the alphabet and counting higher than 20.
Recognizes all of the letters of the alphabet
Counts higher than 20
Writes own first name

*Statistically significant differences were noted for recognizing the alphabet and counting higher than 20, but not for name writing.
School-Aged Children and Adolescents
Parental involvement in the activities of school-aged children

In 2010, parents were asked to indicate how many times during a typical school week, including the weekend, they participated in common activities together with their child.

The activities included:

- Reading or talking about books together
- Doing homework or school projects
- Playing sports or being physically active

The patterns differ significantly by age.
During a typical school week, including the weekend, how often do you read or talk about books together with your child?

Hennepin County Children 2010

**Parents of a child Aged 6 to 9 years**
- 4 or more times: 52.5%
- 2 or 3 times: 34.9%
- 1 time: 9.3%

SHAPE 2010 – Child Survey: Key findings

- Parent’s awareness of child’s performance at school

In both 2006 and 2010, most parents indicated that they attended all of the parent-teacher conferences provided by the child’s school.

The percentage drops significantly for teens aged 14 to 17, and statistically significant differences were noted by income level.
How often have you gone to a regularly scheduled parent-teacher conference with the child’s teacher? 2006 vs 2010

*Statistically significant differences were noted among age groups and between income level groups.
SHAPE 2010 – Child Survey: Key findings

- Most children are engaged in appropriate activities that support healthy development

In 2010, the SHAPE survey asked a series of questions about typical school day activities, including:

- Doing homework, studying or reading
- Being physically active or playing sports
- Doing fine arts, playing music, participating in dance, drama or choir
- "Screen Time," playing electronic games, watching TV or videos, or using computers for recreation
Typical school day activities

Types of activities and the amounts of time spent tended to vary across age or grade level groups. Some significant gender differences were also noted.

No significant differences on the basis of income level were shown, particularly with regard to meeting the suggested guidelines for healthy behaviors.
On a typical school day, how much time does the child spend doing homework, studying or reading?

Hennepin County 2010
Aged 6 to 17 years

- Less than 1 hour: 60.2%
- 1 to 2 hours: 26.9%
- More than 2 hours: 10.9%
- No time: 2.0%

* See the next slide for age group guidelines on the recommended amount of time to be spent engaged in this activity.

SHAPE 2010 – Child Survey: Key findings

- Engaging in activities that model or support adult role development

In 2010, parents of older children and youths were asked if their child participated in any activities that would tend to support the development of adult roles.

These activities included:

- Doing any type of volunteer work
- Spending time with an adult role-model, such as a tutor, coach or mentor
- Working for pay or working in a family-owned business
- Hanging out with friends without any adult supervision
During a typical school week, including the weekend, how many hours does the youth spend doing any type of volunteer work?

* There are no age group guidelines on the recommended amount of time to be spent engaged in this activity.

Adequate Sleep
More sleep is needed for everyone – especially for teens on school nights

Good sleeping habits are extremely important for all children, but especially for adolescents who are experiencing a period of significant “brain growth.”

However, less than half of all teens aged 14 to 17 got eight or more hours of sleep on all seven nights in the past week.
During the past week, including the weekend, how often did your child get at least 8 or more hours of sleep?

Hennepin County Children 2010
