THE POPULATION, AND THE ENVIRONMENT**

## SHAPE 2002: Racial and Ethnic Data Book

*This report was prepared by:*

Urban Landreman, M.S., M.B.A., Hennepin County Community Health Department

Sheldon Swaney, B.A., Hennepin County Community Health Department

Elizabeth Songalia, M.P.H., Bloomington Division of Public Health

Timothy Zimmerman, B.A., Hennepin County Community Health Department

Yingmei Ding, M.D., M.S., Hennepin County Community Health Department

Margaret Hargreaves, M.P.P., Hennepin County Community Health Department

### Advisory Group

Thanks to the individuals who contributed to this report by providing expert advice and technical assistance: George Bowlin, Michelle Chiezah and Margaret Holm, Hennepin County Community Health Department; Ann Kinney, Minnesota Department of Health; and Michael Finch, UnitedHealth Group.

The team would also like to thank Nancy Leegard, Hennepin County Public Affairs, for the photographs, and Sexton Printing for the report's layout and design.

### Suggested Citation

### Project Task Leaders

George Bowlin, Michelle Chiezah, Yingmei Ding, Urban Landreman, Sheldon Swaney and Timothy Zimmerman, Hennepin County Community Health Department; and Elizabeth Songalia, Bloomington Division of Public Health

### Survey Firm

Todd Rockwood, Colleen King and Keith Onken, Health Services Research and Policy Survey Center, University of Minnesota School of Public Health

### Project Team Members

George Bowlin, Michelle Chiezah, Yingmei Ding, Peter Fish, Suzanne Gaines, Gayle Geber, Margaret Holm, Urban Landreman, Diane Loeffler, Sheldon Swaney, Jessica Trujillo, Gizaw Tsehai and Timothy Zimmerman, Hennepin County Community Health Department; Patty Bowler, Megan Ellingson, Pat Harrison, David Johnson, Gopal Narayanan, David Rak and Abbey Sidebottom, Minneapolis Department of Health and Family Support; Eileen O'Connell and Elizabeth Songalia, Bloomington Division of Public Health; Michelle Anderson and Nancy Leegard, Hennepin County Public Affairs; Noemi Alcocer, Zoua Chang and Mahdi Jama, Hennepin County Multicultural Center; Ann Kinney, Minnesota Department of Health; Michael Finch, UnitedHealth Group; Michael Davern, State Health Access Data Assistance Center (SHADAC), University of Minnesota; Assata Brown, HER; and Kathy Graves, Parenteau Graves

## Acknowledgements

The SHAPE 2002 Project is a collaborative effort of the Hennepin County Community Health Department, the Minneapolis Department of Health and Family Support, and Bloomington Division of Public Health.

The Project Leadership Team would like to thank the people who provided input and advice on the design, development and analysis of the survey. These individuals include: Jan Amberson, Larry An, Rita Ann, Mari Jo Avendano, Carol Berg, Dianne Blaydes, Raymond Boyle, Heather Britt, Joan Bulfer, Joseph R. Burniece, Kathleen Call, Isabel Cardenas, William Craig, Amos Deinard, Amanda Dennison, Charles DiSogra, Dave Dorman, Claudia Egelhoff, Ed Ehlinger, Steven Foldes, Moira Gaidzanwa, Beverly Gerdes, Stefan Gildemeister, Dulcie Hagedorn, Bob Hagen, Chip Halbach, Carmen Hall, Lisa Harnack, Kathryn Horsley, Deborah Huskins, Scott Hedger, Kathy Iverson, Juan Jackson, Camara Phyllis Jones, Kay Junes, Bob Kane, Ichiro Kawachi, Gavin Kearney, Judy Knapp, Cindy Kraemer, Candy Kragthorpe, Nancy Krieger, Mary Jo Kreitzer, Rebecca Kroll, Luther Krueger, Deb Leavitt, Greg Lindberg, Nicole Lurie, Sonja Mackey, J. Madden, Jaime Martinez, Brian Martinson, Lyungai Mbilinyi, Philomena Mensah, Bob Miller, Johanna Miller, Dan Mueller, Sheila Nesbitt, Rosemary O'Meara, Jill Ness, Sandi Pierce, Lara Pratt, Jeanette Raymond, Kim Rowe, Jon Roesler, Christine Reller, Brigid Riley, Sonja Savre, Kathryn Schuchman, Jennifer Schuster-Yeager, Fred Smith, David Stroud, Jared Swanegan, Jennifer Thompson, April Todd-Malmlov, Kent Treichel, Frank White, Lyle Wray and Sue Zuidema.

The Hennepin County Community Health Department and the Bloomington Division of Public Health would like to express their gratitude to the Metropolitan Health Plan whose generous grant has made the printing of this data book possible.

We also thank the many organizations that participated in the design and development of the culturally appropriate components of the project. These organizations include: African American Family Services, African American Men's Project, BIHA Women in Action, Bloomington Advisory Board of Health, Center for Cross-Cultural Health, Centro Cultural Chicano, Chicano Latino Affairs Council, Council on Asian/Pacific Minnesotans, Council on Black Minnesotans, Deu Yang, Division of Indian Work, Edina Advisory Board of Health, Ethiopian Community in Minnesota, Ethiopians in Minnesota, Family and Children's Services, Green Central Clinic, Healthy Start, Hennepin Care South, Hennepin County Community Health Services Advisory Committee, Hispanos in Minnesota, Hmong American Mutual Assistance Association, Indian Health Board of Minnesota, Lao Assistance Center of Minnesota, Lao Family Community of Minnesota, Inc., Lao Women Association, Liberian Community in Minnesota, Minneapolis American Indian Center, Minneapolis Latino Advisory Committee, Minneapolis Public Health Advisory Committee, Minneapolis Senior Citizen Advisory Committee, Minneapolis Urban League, Minnesota Indian Affairs Council, Minnesota Indian Women's Resource Center, North Minneapolis Health Advisory Committee, Powderhorn-Phillips Cultural Wellness Center, Phyllis Wheatley Community Center, Rainbow Research, Richfield Advisory Board of Health, Somali Health Project, Southeast Asian Community Council, Sudanese-American Community Development, Inc., Turning Point, Upper Midwest American Indian Center, Urban Coalition and Vietnamese Social Services of Minnesota.

# Introduction

## Introduction

The Survey of the Health of Adults, the Population and the Environment (SHAPE) is an important health surveillance project that monitors the health of adults in Hennepin County. The project uses a holistic perspective — taking a comprehensive look at the health status, behaviors and health care practices of residents as well as other social and environmental factors that influence their health. First conducted in 1998, the survey was conducted a second time in 2002.

## SHAPE 2002

In 2002, the Hennepin County Community Health Department, in collaboration with the Minneapolis Department of Health and Family Support and Bloomington Division of Public Health, conducted the SHAPE 2002 survey. Data were collected through interviews conducted by the Survey Research Center at the Division of Health Services Research and Policy in the School of Public Health at the University of Minnesota.

The SHAPE 2002 survey results build on the information collected in the first survey, identifying health changes and maintaining the

project's countywide and community-level focus. The SHAPE 2002 data enable local-level analyses of key health indicators, providing public health officials and policy-makers an opportunity to identify emerging issues. Officials can also use the data to evaluate the effectiveness of recent population health initiatives.

## SHAPE 2002 data can be used to:

- Determine if progress is being made toward meeting health objectives
- Monitor the impacts of policy changes and programmatic initiatives
- Identify health disparities
- Garner support for healthy public policies
- Allocate resources based on need

## New Racial and Ethnic Data

Another important objective of the SHAPE 2002 survey is to broaden the definition of “community” to include racial and ethnic communities. To provide statistically reliable survey results for different populations of color, a large number of surveys needed to be completed within each community. This was accomplished by over-sampling neighborhoods with relatively large populations of color.

The survey was designed and implemented to report on six racial and ethnic groups: American Indians, Southeast Asians, Blacks and African Americans (focusing both on U.S.-born and African-born groups), Hispanic/Latinos and Whites. These racial and ethnic groups are significant populations within the county because of their relative size and historical importance. The SHAPE 2002 survey findings provide an important baseline of the local racial and ethnic health disparities that exist across these populations.

Culturally appropriate questions and interview methods were used in the 2002 survey to support the project’s racial and ethnic focus. Members from the various racial and ethnic communities were actively involved in the project’s development, implementation and analysis. In-person interviews were conducted to supplement the telephone surveys. In addition to English, interviews were conducted in four other languages — Spanish, Somali, Hmong, and Vietnamese. Of the 9,959 survey respondents, 2,794 were people of color.

The results of the SHAPE 2002 survey are reported by race and ethnicity in this data book. In this survey, respondents are asked whether they identify themselves as

Hispanic/Latino and whether they belong to one or more racial groups. Those who belong to more than one racial group are also asked which racial group they most identify with. The racial numbers in this book reflect the *primary* racial designations of the respondents. Of note, Southeast Asians are categorized as people who identify themselves as Hmong, Laotian, Vietnamese, Cambodian, Thai, Malaysian, Filipino, or from Singapore or Brunei. African-born Blacks are counted as people who identify themselves as Black or African American and born in an African country.

In this Data Book, ethnicity and race are not treated as mutually exclusive categories; a person of Hispanic/Latino ethnicity may be of any race.

## SHAPE 2002: Racial and Ethnic Data Book

This Racial and Ethnic Data Book is one in a series of early SHAPE 2002 publications, which include *A Preview* and the *Geographic Data Book*. (See [www.co.hennepin.mn.us](http://www.co.hennepin.mn.us) and search for SHAPE 2002 for more information about SHAPE 2002 and for access to on-line documents.) Future reports will include more detailed analyses of the topics touched on in the Preview, additional analyses of the racial/ethnic data and topic-specific reports.

The *Racial and Ethnic Data Book* is organized by topic. The first section, “How to Read the Data Tables,” gives general directions on reading and interpreting the data presented in the tables along with a description of important technical features of the tables, such as confidence intervals, and explains how to

understand and use them. The contents of the remaining sections are described below.

- **Overall Health:** The topics include overall health status, physical and mental health, chronic conditions (including asthma, diabetes, heart trouble and depression) and fall-related injuries.
- **Health Care Access and Utilization:** The tables report on a broad range of topics, including health insurance coverage, dental coverage, need for health care, reasons for delays in seeking care, usual source of care, use of alternative healing practices, comfort talking with a health care provider, last physical exam and use of preventive health care — getting a flu shot, cholesterol check, mammogram, Pap test or prostate cancer screening.
- **Healthy Lifestyle and Behaviors:** The topics cover people’s daily consumption of fruits, vegetables, and high-fat foods; weekly participation in moderate and vigorous exercise; current smoking and drinking habits; adult beliefs and opinions of under-age alcohol use; use of seat belts; and body weight.
- **Social-Environmental Factors:** The topics include respondent’s level of social support; involvement in school, community or neighborhood activities; perception of the community; attendance at religious worship

and cultural activities; importance of cultural heritage; level of economic distress; and the experience of discrimination in getting a job, at work, getting medical care, getting housing, getting a loan, applying for public assistance or dealing with the police.

- **Demographics:** The tables provide SHAPE 2002 data on key demographic variables, including age, gender, residence, country of origin, length of time in the U.S., marital status, educational attainment, labor force participation, type of household and gay/lesbian/bisexual/transgender (GLBT) status.
- **Census 2000:** Information from the 2000 Census that complements the SHAPE data is included. Some of the topics included are age distribution, educational attainment, poverty level, unemployment, and type of household.

The final section of the Data Book includes a description of the survey sample and a methods section, which outlines the survey’s sampling design, survey response rate, weighting of the sample data and potential sources of bias in the results.

# How to Read the Tables

## General

This data book reports results for most health indicators for county residents by the racial and ethnic groups that the SHAPE 2002 survey targeted. The results are organized into the following health domains:

- Overall health
- Health access and utilization
- Healthy lifestyle and behaviors
- Social-environmental factors
- Demographics

Information from the 2000 Census that complements the SHAPE results is also included.

Some survey questions were asked only of selected population subgroups - such as young adults aged 18-24 - and thus are only intended to provide county level data. The results for these questions are not presented in this data book. Some other questions are part of a survey

question set, and are asked only of pertinent sub-groups among all survey respondents after the lead question; these questions normally have a much smaller sample size than other questions. For these questions, the sample sizes for many racial and ethnic groups are too small to provide meaningful results.

In most data tables, the title is the actual survey question and is presented as it was asked (e.g., “Do you currently have insurance that pays for dental care?”). Some tables report results that are calculated from one or more survey questions; the titles for these tables will state the content of the data tables without being in question form (e.g., “Weight status using the Body Mass Index calculation”); the actual survey questions used for calculation and applicable calculation methods are captured in a footnote. References for the methodology used in these calculations and for other aspects of SHAPE are included in the Key References List located in the Appendix.

All results are reported as **percentages** (%) with corresponding 95% **confidence intervals** (C.I.). One exception is the table on page 17, the “Average number of unhealthy days during the past 30 days” where the **average**, or mean, and its corresponding confidence intervals are reported.

To illustrate racial and ethnic variation in health status, a bar chart is plotted beneath each data table showing the results for that health indicator for the six racial and ethnic groups that were targeted by SHAPE 2002. Results are shown for U.S.-born Black, African-born Black, American Indian, Southeast Asian, White and Hispanic/Latino residents, for Hennepin County as well as for Minneapolis. For health indicators that have multiple response categories, one response category or a combination of response categories is plotted in the bar chart. For data tables that report multiple health indicators, one selected health indicator is presented in the bar chart.

## Data Tables

### *Rows and columns*

Most of the data tables in this report are similar to the table shown in Figure 1. Each **row** on a table corresponds to a racial or ethnic group.

Racial and ethnic group data are presented for Hennepin County Total as well as for the City of Minneapolis. SHAPE 2002 was not designed to provide racial and ethnic results for suburban Hennepin County or for smaller geographic areas within the city of Minneapolis due to the distribution of racial and ethnic populations, technical difficulties in reaching survey respondents randomly, and limited resources.

Data are presented for four large racial groups – Black/African American, American Indian, Asian/Pacific Islander and White. Within two of these large racial categories, subgroups that SHAPE 2002 targeted are also presented, these being U.S. born- and African-born under Black/African American, and Southeast Asian under Asian/Pacific Islander. As noted in footnote 1 in each table, the sum of the subgroups may not add up to the total of the overall racial group. This is because in addition to the subgroup(s) reported in the table, there are (or may be) other subgroups under that particular racial group that are not presented separately because there were too few respondents in the sample.

Data are also presented for all races, which include all persons in the four large racial groups as well as those who identified their race as other, multiple race or unknown race. The total sample size for all races will not equal the total of the four large racial groups reported. This is noted in footnote 2 in each table.

Only one ethnicity, Hispanic or Latino is reported. Hispanic/Latino ethnicity and race are not mutually exclusive. A person of Hispanic or Latino ethnicity may self-identify as any race. This is noted (footnote 3) in each table.

The **columns** on a table show the sample size (number of cases, or **N**) within each racial or ethnic group, and the percentage of respondents within that racial or ethnic group who gave a particular response to the question being presented in that table.

The percentage of respondents giving a particular response is listed as a pair of numbers, %  $\pm$  95% C.I. These numbers should be interpreted in the following way: % is the percentage of respondents in the sample from that group who gave that particular response to the question. 95% C.I. is the number of percentage points that should be added to or subtracted from the percentage to obtain the upper and lower limits of the 95% confidence interval for the percentage.

For example, in Figure 1, in the column labeled “Response 2” and the row labeled “Black/African American” in the Hennepin County Total section, the percentage = 27.9% and the 95% C.I. = 4.8%. Thus, the 95% confidence interval is 23.1% (27.9% - 4.8%) to 32.7% (27.9% + 4.8%).

Please note that the sample size or **N** presented in the table is the actual number of respondents for that particular racial or ethnic group, while the % and the 95% C.I. are weighted results. The weighted sample size may be different from the observed sample size. For more information, please refer to the *SHAPE 2002: Methodology Report* (to be published at a later date). To access the report, go to the web site [www.co.hennepin.mn.us](http://www.co.hennepin.mn.us) and search for SHAPE 2002.

## How to Read the Tables

The denotations for the symbols or signs used in the data tables are:

- N: Sample size (unweighted or actual number of survey respondents)
- %: Percentage
- Ave. Average or mean
- C.I. Confidence interval

Results will not be presented if the actual number of respondents (sample size) for any racial or ethnic group is less than 30.

### *Calculation of results not presented on the tables*

It is important to note that data that are not provided in a table cannot be calculated from the data provided in the table.

The reader may think that data that are not presented in the table may be derived from the marginalization of the data provided, such as using specific calculations to obtain estimates for suburban Hennepin County for each of the racial and ethnic groups, for the group other race/multiple race/unknown race, or for non-Hispanic/Latino ethnicity. For SHAPE 2002 data, *such a practice is methodologically incorrect and must not be attempted* due to the following reasons:

- All percentages and corresponding 95% confidence intervals are weighted results, and different weights are used for different estimates.
- The sample sizes provided are the actual numbers of survey respondents and are not weighted sample sizes.

Three different sampling weights are used to weight the SHAPE 2002 sample to provide results for the different racial/ethnic groups, for Hennepin County Total as well as for the City of Minneapolis. The *SHAPE 2002: Methodology Report* will provide detailed information on each of these weights and how each was derived.

### Confidence Intervals

A confidence interval (C.I.) is sometimes called the “margin of error.” A 95% confidence interval can be interpreted as follows: if the survey was

conducted again, 95 times out of 100, the estimate for the actual percentage (%) would fall within the range  $\% \pm 95\%$  C.I. In the example above, this means that 95 times out of 100, the percentage for Response 2 for Black/African Americans in Hennepin County Total would fall somewhere between  $27.9\% \pm 4.8\%$  or between 23.1% to 32.7%.

Confidence intervals can be used to determine the reliability of an estimate from SHAPE 2002, and can also be used to compare between groups to see if the difference in the estimates between the groups is statistically significant or not. However, there are also limitations in the use of these confidence intervals in the SHAPE data. Both the uses and the limitations of confidence intervals are discussed below.

### *Uses of Confidence Intervals*

One common use of the confidence interval is to determine the reliability of an estimate from SHAPE 2002: The wider the confidence interval, the less reliable is the estimate.

To continue the example from above, the confidence intervals for Response 2 for Black/African Americans, for American Indians and for Whites in Hennepin County Total from Figure 1 are depicted in Figure 2. Each bar represents the point estimate (the percentage for the respective racial group) and the upper and lower limits of the corresponding 95% confidence interval are plotted. In Figure 2, the confidence interval for Whites is narrower than the confidence interval for American Indians. This implies that the percentage for Response 2 for Whites (40.3%) is a relatively reliable estimate. The percentage for Response 2 for American Indians (29.9%) has a wider confidence interval and is therefore relatively less reliable.

Readers will find that the confidence intervals are very large for some racial and ethnic groups, especially for American Indians. In some extreme cases, the confidence interval is actually larger than the point estimate. This is due to one or both of the following: small sample sizes and large differences in the weights given to members of that group. Caution needs to be given in interpreting the results when this occurs.

Figure 1

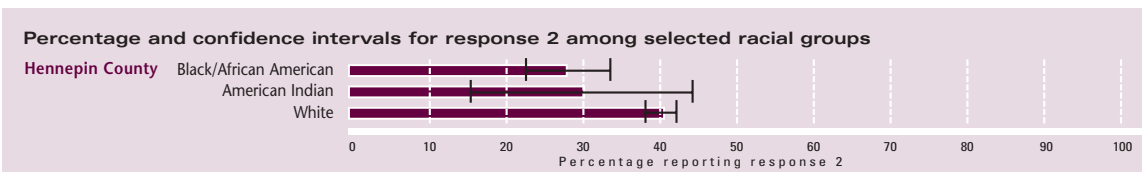

Area	Sample Size N	Response 1 % ± 95% C.I.	Response 2 % ± 95% C.I.	Response 3 % ± 95% C.I.	Response 4 % ± 95% C.I.	Response 5 % ± 95% C.I.

All Races <sup>2</sup>	6,603	23.1% ± 1.5	36.4% ± 1.7	27.2% ± 1.6	11.1% ± 1.1	2.2% ± 0.5
HISPANIC/LATINO ETHNICITY <sup>3</sup>	512	13.7% ± 4.3	21.5% ± 5.1	33.7% ± 5.5	29.5% ± 5.6	1.6% ± 1.6

<sup>1</sup> The sum of the subgroups may not add up to the total because not all subgroups are listed in this table.

<sup>2</sup> All Races also includes persons who identified their race as Other, Multiple Race, or Unknown.

<sup>3</sup> HISPANIC/LATINO ETHNICITY and RACE are not mutually exclusive: a person of Hispanic/Latino ethnicity may be of any race.

Figure 2

Many factors contribute to wide confidence intervals; foremost in the SHAPE 2002 data are the small sample sizes of some of the racial/ethnic groups, and the particular sampling methodology used in oversampling the racial/ethnic groups. These issues will be discussed in detail in the *SHAPE 2002: Methodology Report*.

Another use of the 95% confidence interval is to compare differences in percentages between racial and ethnic groups. The general rule is that if there

is **no overlap** between the confidence intervals for the percentages from different racial or ethnic groups, then there is a statistically significant difference between the percentages. However, if the confidence intervals for different groups **do overlap**, then there is no statistically significant difference between them.

Returning to Figure 2, it can be seen that the confidence intervals for Black/African Americans and Whites do not overlap. This means that the

## How to Read the Tables

percentages for these groups (27.9% and 40.3%, respectively) **are** significantly different statistically. In contrast, the confidence intervals for Black/African Americans and American Indians do overlap, meaning that the percentages for these groups (27.9% and 29.9%, respectively) **are not** significantly different statistically.

### *Limitations of Confidence Intervals*

An important **limitation** of using confidence intervals to determine statistical significance is that such use may occasionally lead to incorrect conclusions about whether or not the difference is statistically significant. This is particularly likely to happen when the ends of the confidence intervals are very close (i.e., just barely do or do not overlap).

Another **limitation** in the use of confidence intervals in the SHAPE 2002 data involves the results for the Hispanic/Latino group.

As indicated previously, race and Hispanic/Latino ethnicity are not mutually exclusive, since a person of Hispanic/Latino ethnicity may be of any race. This poses difficulties in comparing the Hispanic/Latino group with any particular racial group on the health indicators in this data book, because respondents who are both Hispanic/Latino and members of that racial group end up being counted more than once in the comparison. In fact, such overlap **prevents** making direct comparisons between the Hispanic/Latino group and any particular racial group. The use of confidence intervals to compare estimates from different groups is based on the assumption that the groups are independent of each other, and this assumption does not hold between Hispanic/Latinos and the different racial groups. *Making statistical comparisons between the Hispanic/Latino group and specific racial groups may result in incorrect conclusions and should not be undertaken.* On the other hand, comparisons between the Hispanic/Latino group and Hennepin County Total (or between Hispanic/Latinos in Minneapolis and the whole of Minneapolis) are appropriate, since the Hispanic/Latino group is completely nested within the larger group.

A third limitation of the confidence intervals in these data tables is that those presented are *forced symmetric*, which are often wider than the actual confidence interval. The conventional method for confidence interval calculation uses the normal approximation, and will lead to a confidence interval that is symmetric around the point estimate (either a percentage or an average).

However, the conventional method cannot provide correct confidence interval calculations for the SHAPE 2002 data due to its complex survey design. Instead, a robust method (called the Sandwich method) for confidence interval calculation via the statistical package STATA is used. The confidence intervals calculated via this robust method often lead to an asymmetric confidence interval around a point estimate (either a percentage or an average). For example, in Figure 1, the exact 95% confidence interval for Black/African Americans in Hennepin County Total for Response 2 is 23.5% (27.9% - 4.4%) to 32.7% (27.9% + 4.8%), slightly asymmetric around 27.9%.

To simplify the data for our readers, we used the absolute value of the large end of the asymmetric 95% C.I. to provide a symmetric C.I. for the point estimate. In the above example, the 95% C.I. of 4.8% is used to provide the upper and lower end confidence intervals, symmetric around 27.9%. It should be noted that some lower confidence intervals might end with a value that is less than 0%. In this case, 0% should be used as the confidence interval lower limit.

### Contact Us

Many of the limitations of the confidence intervals presented in this data book (such as forced symmetry) can be overcome by using specific statistical techniques in the analysis of the SHAPE 2002 data. For precise statistical comparisons of estimates between different groups, additional analyses should be performed. The reader should contact Hennepin County Community Health Department staff at 612-348-3925 for more information.

<sup>2</sup> All Races also includes persons who identified their race as Other, Multiple Race, or Unknown.

<sup>3</sup> HISPANIC/LATINO ETHNICITY and RACE are not mutually exclusive: a person of Hispanic/Latino ethnicity may be of any race.

<sup>4</sup> Body Mass Index (BMI) is a measure of a person's weight in relation to that person's height. BMI is computed by dividing a person's weight in kilograms by the square of that person's height in meters or by dividing a person's weight in pounds by the square of that person's height in inches and then multiplying the result by 703. BMI categories are: underweight (< 18.5), normal weight (18.5 – 24.9), overweight (25.0 – 29.9), and obese (≥ 30). The definitions for the BMI categories changed after the initial release of the SHAPE 1998 data, so one needs to check which of the definitions were used when comparing results.

<sup>5</sup> Healthy People 2010 Objective is to increase to 60% or more the proportion of adults who are at a healthy weight.

### Percentage who are overweight or obese based on the Body Mass Index calculation

<b>Minneapolis</b>					
RACE <sup>1</sup>					
Black/African American alone	23,194	7,374	31.8%	1,550	6.7%
American Indian alone	2,417	632	26.1%	259	10.7%
Asian/Pacific Islander alone <sup>2</sup>	6,577	2,020	30.7%	780	11.9%
White alone	124,341	54,099	43.5%	18,838	15.2%
Some Other Race alone	3,743	577	15.4%	489	13.1%
Two or more races	4,482	1,642	36.6%	480	10.7%
All Races	164,754	66,344	40.3%	22,396	13.6%
HISPANIC/LATINO ETHNICITY <sup>3</sup>	7,036	1,238	17.6%	865	12.3%

<sup>1</sup> The 2000 Census respondents could choose to self-identify from one or more of the following six racial groups: White, Black or African-American, American Indian and Alaska Native, Asian, Native Hawaiian and Other Pacific Islander, and Some Other Race. Census respondents selected either one racial group alone or two or more.

<sup>2</sup> Includes Census respondents who self-identified as either Asian alone or Native Hawaiian or Other Pacific Islander alone. Persons who self-identified as Asian and Native Hawaiian or Other Pacific Islander are included in the Two or more races group.

<sup>3</sup> HISPANIC/LATINO ETHNICITY and RACE are not mutually exclusive: a person of Hispanic/Latino ethnicity may be of any race.

# Survey Methods

## Sampling Design

The SHAPE 2002 data were collected primarily through telephone interviews, supplemented by in-person interviews, that were conducted by the Survey Research Center at the Division of Health Services Research and Policy located in the School of Public Health at the University of Minnesota. Of the 9,959 interviews completed, 9,781 were conducted by telephone and 178 were conducted in person.

Survey respondents were selected at random through a two-stage process. In the first stage, a sample of Hennepin County households with listed telephone numbers was obtained from Survey Sampling, Inc. (SSI). Almost all (99.2 %) Hennepin County households have telephone service (according to the 2000 U.S. Census). This telephone list of 246,919 households from SSI excluded a large number of unlisted telephone numbers,

cell phone numbers, and phone numbers from group quarters (e.g., college dormitories). In addition, it excluded several large apartment and condominium buildings in Minneapolis and several suburban communities.

Consequently, the phone list was augmented with 200 telephone numbers from student dormitories at the University of Minnesota, and with 7,913 telephone numbers for apartment and condominium building units missing from the SSI sample. A random sample of households was then drawn from the augmented list.

In the second stage of sampling, one adult from each sampled household was selected to participate in the survey. To select the respondent, the person answering the phone was asked to identify the adult in the household who had most recently had a birthday. This person became the designated respondent for that household. The survey was translated and conducted in Spanish, Somali, Hmong and Vietnamese for respondents who spoke these languages. Of the total surveys, 1,007 were conducted in a language other than English.

To provide results for each of the five racial and ethnic communities of special interest to this study, a sufficient number of surveys needed to be completed within each community in order to conduct statistically reliable analyses. This was accomplished by over-sampling geographic areas in which a relatively large proportion of the population was from the racial and ethnic communities of interest.

### Survey Content

The SHAPE 2002 survey instrument took ten months to develop. Most survey questions were drawn from existing instruments, including the SHAPE 1998 questionnaire; others were written specifically for this study. The survey's content areas include:

- General mental and physical health status
- Chronic health conditions
- Access to health insurance and care
- Receipt of preventive health screening
- Health risk behaviors including smoking, alcohol drinking, nutrition, and exercise
- Injury
- Community social support
- Neighborhood safety
- Experiences of discrimination
- Economic distress

In addition, questions were asked regarding socio-demographic characteristics including age, gender, race, ethnicity, country of origin, marital status, education, employment status and income.

### Survey Response Rate

In Hennepin County, 15,237 households were contacted between January and August 2002, and 10,098 interviews were completed. This represents a response rate of 66.3% for the county as a whole. In the fielding of the study, all phone numbers (for which there was no answer) were called a minimum of 20 times; these calls were spread out across daytime and evenings on both weekdays and weekends. In many instances, 30-40 attempts were made; the single highest number of attempts for any

telephone number was over 80. Incorporating the information for unanswered calls, as well as that for known not-eligible numbers (such as business phone numbers, and disconnected phone numbers), the cooperation rate for the study was 75.4% and the refusal rate was 21.6%. (This is the methodology used by the American Association for Public Opinion Research.) The cooperation rate is probably a better reflection of the actual rate of participation for the study, since it is based upon how many households were actually contacted for participation in the study, rather than the total number of telephone numbers attempted.

### Weighting of Sample Data

For the data analyses, a statistical procedure called weighting was applied to the sample data. Weighting ensures that the data represents the community and racial/ethnic groups from which it was sampled, and allows for estimates from the data to represent the entire county population. SHAPE 2002 was designed to provide data for different geographic areas and also for specific racial/ethnic communities. Greater detail on the specific weighting techniques performed and on other technical issues regarding the SHAPE 2002 data will be covered in the *SHAPE 2002: Methodology* report, to be released at a later date.

### Potential Sources of Bias to the Survey Results

The results of the study allow conclusions to be drawn about the health of all adults currently living in Hennepin County. However, several limitations of the survey design and constraints on the data collection should be taken into consideration. One common source of bias in telephone survey data is non-telephone bias – the people who could not be surveyed because they lacked phone service may be different than those with phones who were surveyed. Another common source of bias is non-response bias – the people who refused to take the survey may be different than those who cooperated and answered the survey questions.

## Survey Methods

Another potential source of bias may arise when a selected adult is not interviewed or when a sampled household is never contacted. In a number of cases, the University interviewer was not able to speak with the appropriate adult in a sampled household, even after many calls on different days and at different times of day. In other cases, the selected adult refused to participate in the study. To the extent that non-respondents are somehow different from respondents on the health-related variables in this study, the survey results would be biased.

Special efforts were made to obtain the largest possible response among the racial and ethnic communities of special interest to this study. One of these efforts was to translate the survey instrument into Spanish, Somali, Hmong and Vietnamese and to conduct the survey in these languages for respondents who needed them. The translations were performed by Betmar, a contracted organization highly experienced in translation. Despite the skill and oversight with which the translations were performed, there remains the possibility that the meaning of some survey questions could have changed as a result of translation, which again could bias the survey results.

# Description of SHAPE 2002 Sample

The responses given by 9,959 adults in Hennepin County are the basis for the findings of the SHAPE 2002 survey. As described in the Survey Methods section of this report, the responses for each of the survey participants are given a weight. The weight reflects 1) the different sampling probabilities that were in place within each of the geographic area and 2) the adjustments taken to make the demographics of the sample more similar to the whole population of the county. Thus one respondent's answers will be weighted up if he or she is a member of an under-represented group or weighted down if he or she is a member of an over-represented group compared to the general population of the county.

Thus, it is important to know the actual number of people who participated in the survey. That number will likely be different than the "weighted" number of respondents for any particular subgroup. One does not want the answers given by a very small number of actual respondents to be weighted up by a huge factor and then claim that they are representative of the entire population of that group. In this report, results are not displayed for any subgroups when there were fewer than 30 people in that subgroup.

## Description of SHAPE 2002 Sample

The distribution of the SHAPE 2002 respondents by their race and ethnicity is shown in Figure 3.

Figure 3

### SHAPE 2002: Number of respondents by race/ethnicity and location

	Minneapolis	Suburban Hennepin County	Total Hennepin County
<b>Race</b>			
<b>White</b>	4,480	2,836	7,316
<b>Black/African-American Total</b>	1,023	181	1,204
U.S.-born	516	97	613
African-born	484	75	559
Other	23	9	32
<b>American Indian</b>	202	22	224
<b>Asian/Pacific Islander Total</b>	463	183	646
Southeast Asian	339	128	467
Other Asian	103	49	152
Pacific Islander	21	6	27
<b>Other/Unknown</b>	470	99	569
<b>Total</b>	<b>6,638</b>	<b>3,321</b>	<b>9,959</b>
<b>Ethnicity</b>			
<b>Hispanic/Latino</b>	518	116	634
<b>Non-Hispanic</b>	6,120	3,205	9,325
<b>Total</b>	<b>6,638</b>	<b>3,321</b>	<b>9,959</b>

The distribution of the respondents by geographic sampling area is shown in Figure 4. Note that some of the areas, for example, the Longfellow community in Minneapolis, were subdivided into smaller areas for sampling purposes. The adults

living in these smaller areas were sampled at different rates to more efficiently include adequate numbers of members of various subpopulations within the county while keeping the total number of persons surveyed as low as possible.

# Description of SHAPE 2002 Sample

## SHAPE 2002: Geographic Sampling Areas

# Key Reference List

The “total number of unhealthy days” variable, reported in the data tables on pages 15 and 17, was calculated following the method published by the Centers for Disease Control and Prevention:

- Centers for Disease Control and Prevention. (2000). *Measuring healthy days*. Atlanta, Georgia: Centers for Disease Control and Prevention.

The “body weight status” variable uses a body mass index that is reported in the data table on page 69. The variable was classified according to the clinical guidelines published by the U.S. Department of Health and Human Services:

- U.S. Department of Health and Human Services. (1998). *Clinical guidelines on the identification, evaluation, and treatment of overweight and obesity in adults: the evidence*. Bethesda, MD: U.S. Department of Health and Human Services, National Institute of Health, National Heart, Lung and Blood Institute.
